

FLAT PANEL DISPLAY MOUNTING BRACKET

Abstract

An apparatus for mounting a flat panel display screen in a vehicle includes a mounting plate. At least one friction hinge enables the mounting plate with mounted display screen to be rotated, pivoted, or the like to any one of many configurations having a variety of angular relationships with the dashboard or other supporting surface about a first pivot axis substantially parallel to the supporting surface. The mounting plate has a plurality of fastener openings and is thereby adapted to support a display panel at a plurality of locations.
